

GC Chaser

The GC Chaser is designed to reduce cool down times between sample runs for an Agilent GC. Which shaves time off of every run allowing you to generate more revenue by running more samples per day.

GC Racer

The GC Racer is designed to augment the heating capacity of an Agilent GC, to give you the ability to run more samples in a given amount of time which will save you labour costs by reducing/ eliminating over time cost during your busy season.

Auxiliary Cooling System

GC Chaser

The GC Chaser is an easy and effective way to increase instrument productivity by reducing the cool down time between sample runs. It is a powerful centrifugal blower that will move cooler ambient air through the GC oven in a much greater volume than the GC fan can accomplish by itself. The GC Chaser will not affect current methods and does not require re-qualifying as it does not affect the sample run, just the cooling time between samples. Once the GC Chaser is installed and powered on, it requires no further operator input. It works seamlessly and transparently.

Optional GC Chaser Cool On-Column Inlet add-on

Let the forced cooler air quickly cool down the inlet. The COC add-on uses the compressed air line commonly used in a lab and is an inexpensive way to quickly cool the inlet between sample runs. Once installed, it requires no operator input. Easy, cost-effective and transparent.

Contact your local K'(Prime) Technologies' Sales Representative for a quote today and instantly increase your lab's productivity with our line of auxiliary cooling and heating products.

Auxiliary Heating System

GC Racer

The GC Racer is an effective add-on to any Agilent GC that can pay for itself within one month. It is designed to augment the heating capacity and helps achieve a stable high temperature ramping program.

Once your method has been optimized with the GC Racer, there will be a noticeable reduction in sample run times. The GC Racer is a must have for PAH, TPH, CCME, Sim DIST methods.
